#### Aesthetic Design Choices

- My theme is grayscale to place an emphasis on the photos, rather than on the design of the website.
- A highlight color of pink was added to more clearly display links and add a bit of character to the site.
- Albums and thumbs are all regular sizes to keep the display neat and clean.

#### Functionality Design Choices

- **Home Page:** Guests have an option of viewing albums, viewing photos, or searching photos. A logged in admin also has the option of uploading photos.
- **Albums Page:** Displays all the albums, along with their titles, the number of photos they contain, and the date modified. The admin can create a new album by clicking “New Album”. The admin can edit the album title by clicking on the title and typing in a new title (changes are automatically updated through AJAX). Clicking on an album from the “Albums” page displays all of the photos in the album, along with the album’s date created and a link for deleting the album. The admin can edit the photo caption by clicking on the caption (changes saved through AJAX). Clicking on any photo will go to view\_photo.php (read more below)
- **Photos Page:** Displays all the photos, including those not in any album, starting with the most recently added. Clicking on a photo will go to view\_photo.php (read more below)
- **View\_photo.php:** Displays a single photo with its caption, list of albums it is in, and the date taken. Admins can edit the caption, delete the photo, or add/remove it from albums.
- **Login:** Allows the user to login
- **Upload:** Allows admins to upload new images
- **Search:** Typing anything into the search box in the menu will send the user to the search page. Searching by keyword looks for photos with a matching caption or album title. Searching by title looks for albums with a matching title. Searching for caption looks for photos with a matching caption. Combined searches also work.

#### Improvements from Feedback

- Fixed the back to albums link that was broken for albums with only one photo
- Added more content to the home page
- Allowed jpeg as an acceptable image format

#### WOW

- jQuery and AJAX was used to allow admins to easily change album titles and photo captions
- Photos not in any album can still be viewed in the Photos page.
